Practicing jQuery

DOM Manipulation

Open the provided manipulation.html file. The following practice mimics the dynamic creation of a navigation list.

You may not modify the html of this page (other than adding <script> tags)

Perform the following:

- Create a for-loop that runs 10 times

    - In the loop, use the `$()` factory to build an <li> with an anchor, using the loop's index as the anchor text.. *(remember that the number is dynamic)..* for example:

        - `<li><a href="#">0</a></li>`

    - Use the `.appendTo()` method to add the li to "`#navleft`"

    - Next, use a traversing method to target just the anchor from the li, and use `.css()` to change its color to #e50, and its font size to 14px.

- Now, after the loop, use the `.clone()` method to copy all of the li elements from #navleft, and append them into #navright.

    - Next, use a traversing method to target the anchors in the newly copied li elements, and change all the anchors' font size to 30px.

- Finally, reduce your code so that you are using only two `$()` factories *(not including the dom-ready function).*
